Encrypter Description: By the way, Encrypter will run in Windows XP (SP3) and later. All the source code is available at GitHub, making it easy to get around the.NET Framework for any project. Useful, but lacking It's a good idea to have your documents secured with an encryption tool, but is Encrypter a good fit? It's a basic tool with little options to configure, not to mention file support. Pros Just like a Windows.docx or.pptx file, Encrypter stores the information in encrypted format. The information stored cannot be read until a key is provided, which is typically saved in a file. To decrypt the content, users need to provide a key. It's a simple process, and in fact easier than most other encrypted file systems. Encrypter stores a public key and the encrypted content in separate files. When a user wants to decode the text, they simply need to provide the file containing the public key. File support is limited to plain text. There is no support for encrypted content in text files, which means you can't decode an encrypted text file. Keystrokes are decrypted automatically on Windows systems. All you need to do is get the application running, start typing, and Encrypter will decrypt the text in your input. Open source Encrypter is free, and all source code is provided on GitHub. There are no additional fees for using the application, and the encryption tool requires no computer configuration. This means you can easily use Encrypter for temporary texts, and it will make sure your sensitive documents are secure. Cons Encrypter only supports text, which means it only encrypts text, and you cannot encrypt or decrypt files. File support is missing entirely. The application also requires.NET Framework. Although it's free to use, Encrypter lacks in the way it encrypts content. Encrypting text strings can be slow, and requires a fast internet connection to keep your documents secure. Recommendation Overall, it's a useful encryption tool, but it's missing a few more features for home use. If your goal is to secure sensitive documents, this may be a good option, but for most people it's not suitable. If you have a need to keep sensitive data private, Encrypter is a good choice.
